EXPERIENCE

Apr/2021 - June/2021	**Twin Sun Solutions**

Software Developer
•Built web applications using Ruby on Rails
•Optimized in-production apps for mobile use
•Built out internal tools to accelerate development process
•Added features to React app being built by the company

Jul/2020 - Jan/2021	**Nashville Software School**

Junior Full Stack Developer
•Built single-page applications with HTML, CSS, and JavaScript
•JavaScript basics leveraging DRY code and reusable components
•Leveraged external APIs such as openWeather and the NPS API
•Used JSON database to practice fetch calls: GET, POST, PUT

Jan/2019 - Jan/2021	**Clair Solutions**

Systems Designer
•Find all the components to create a unified AVL system
•Gather requirements from clients and other stakeholders
•Manage budgets range from $100,000 to $500,000 on average
•Build budget proposals and estimate our team's labor

Mar/2013 - Oct/2018	**Mankin Media Systems**

Deploy Technician/ Systems Designer/Scrum Master
•Field installation of audio, video, lighting systems
• Selected equipment, drew functional diagrams in AutoCAD
• Implemented scrum framework

EDUCATION

Web Development Bootcamp	2020 - 2021
Nashville Software School	
Bachelor of Arts in Music	2001 - 2005
Georgia State University	

PERSONAL PROJECTS

HeyBurrito!
https://hey-burrito-app.herokuapp.com/
My favorite burrito shop in town only takes call or fax for to-go orders. My app fixes that by recreating the menu and allows users to add and customize menu items to their order. Once an order is created, an employee view shows a list of all incoming orders. Those orders can be viewed in aggregate and then sent as an e-mail (to go to a printer) or deleted. HeyBurrito is built with ReactJS, EmailJS, and Grommet.

Daily Dashboard
https://github.com/travisbrigman/dailyDashboard
This is a tvOS app that brings a random picture of a National Park back from the Unsplash API as a background image. It then displays the current date and time. Lastly it fetches current weather data and displays that information to the user. This app was inspired by those Windows 10 login pages. I love the images that you get to see and wanted to bring that into a big screen with a tvOS app.

Quotr
https://github.com/travisbrigman/quotrclient
https://github.com/travisbrigman/quotr-server
This is my capstone app for NSS. The app aims to solve the problem of creating accurate proposals quickly. Using a pre-seeded database, a user looks through a table and adds items to a proposal. They can make batch updates to items in proposals, they can also edit, create and delete items in the database. The front-end is built in React and the the backend is Python with the Django Rest Framework plugin.
